## 1. Summary of test results

The presented GSM 850/900/1800/1900 Module can be build inside host applications and extends their capability by wireless GSM technology. Data transmissions or voice applications are possible field applications.

In order to verify the compliance with applicable rules, a representative configuration consisting of representative auxiliary equipment was chosen. Embedded in this configuration, the GSM Module can be tested. Pls. refer to set-up description and photos for more details.

Following tests have been performed to show compliance with applicable FCC Part 2, Part 22, Subpart H and Part 24, Subpart E (Broadband PCS) of the FCC CFR 47 Rules and RSS-132, RSS-133 and RSS-Gen.

The test results apply exclusively to the test samples as presented in chapter 3.1. The CETECOM GmbH does not assume responsibility for any conclusions and generalizations taken in conjunction with other specimens or samples of the type of the item presented to tests.

Receipt of EUT:	2011-02-02
Date(s) of test:	2011-02-03 - 2011-02-17
Date of report:	2011-03-02
-----	
Version of template:	09.06 _All.Dotm

### 2.4. Applicant's details

Applicant's name:	Cinterion Wireless Modules GmbH
Address:	Siemensdamm 50 13629 Berlin Germany
Contact person:	Mr. Stefan Ludwig

### 2.5. Manufacturer's details

Manufacturer's name:	please see Applicant's details
Address:	please see Applicant's details

### 3.3. EUT: Type, S/N etc. and short descriptions used in this test report

Short description*)	EUT	Type	S/N serial number	HW hardware status	SW software status
EUT A	Quad-Band GSM/GPRS Module	BGS2-W	IMEI: 004401-08-048446-8	B2.1	00.960
EUT B	Magnetic Mount antenna	MAR-C3G-2F	CTC#1	2dBi Gain	--
EUT C	Handset Votronic	For M20T, MC35T, TC35T, DSB35	4017953211304	HH-SI-30.3/V2.0/0	--
EUT D	Adapter Board for BGS2-W	Ven_60/80_0035	#1	--	--
EUT E	DSB Board + flat ribbon connection+ Adapter BG2_PH8_Ada_0207	DSB75	0911007 ICM-100012-03	B1.1	--
EUT F	Quad-Band GSM/GPRS Module	BGS2-W	IMEI: 004401-08-048449-2 (WMC0004AD0a)	B2.1	00.960

\*) EUT short description is used to simplify the identification of the EUT in this test report.

### 3.4. Auxiliary Equipment (AE): Type, S/N etc. and short descriptions

AE short description *)	Auxiliary Equipment	Type	S/N serial number	HW hardware status	SW software status
AE 1	Notebook	Dell D610D	CTC PC3	--	Windows XP + Terminal program
AE 2	AC/DC Adapter	FW7238/09	1401	Input: 100V – 240 V AC/50-60Hz/180mA Output: 9V DC/800mA	--

\*) AE short description is used to simplify the identification of the auxiliary equipment in this test report.

### 3.5.EUT set-ups

EUT set-up no. *)	Combination of EUT and AE	Remarks
Set. 1	EUT A + EUT B+ EUT C + EUT D + EUT E + AE1	set-up used for tests: radiated
Set. 2	EUT F + EUT B +EUT C + EUT D + EUT E + AE1	set-up used for tests: radiated
Set. 3	EUT F + EUT B + EUT C + EUT D + EUT E + AE1	set-up used for conducted RF-tests
Set. 4	EUT A + EUT B+ EUT C + EUT D + EUT E + AE1 + AE2	set-up used for tests: conducted according EMI- AC Power line

\*) EUT set-up no. is used to simplify the identification of the EUT set-up in this test report.

### 3.6. EUT operating modes

EUT operating mode no. *)	Description of operating modes	Additional information
op. 1	GSM 850 TCH mode TCH=128/192/251	A communication link is established between the mobile station and the test simulator. The transmitter is operated at its maximum rated output power: 33 dBm (power class 4; power control level 5). The input signal to the receiver is modulated with normal test modulation. The wanted RF input signal level to the receiver of the mobile station is set to a level to provide a stable communication link.
op. 2	GSM 1900 TCH mode TCH=512/661/810	A communication link is established between the mobile station and the test simulator. The transmitter is operated at its maximum rated output power: 30 dBm (power class 1; power control level 0). The input signal to the receiver is modulated with normal test modulation. The wanted RF input signal level to the receiver of the mobile station is set to a level to provide a stable communication link

\*) EUT operating mode no. is used to simplify the test report.

### 3.7. Parameter Settings on mobile phone and base station CMU200

Following settings apply to the MS during the measurements in **GSM/(E)GPRS-Mode** only:

Parameter	Traffic Mode	Idle Mode
Traffic Channels mobile station (EUT)	GSM 850 TCH <sub>MS</sub> = 128 / 192 / 251 GSM 1900 TCH <sub>MS</sub> = 512 / 681 / 810	--
maximum power level (PCL)	GSM 850: PCL = 5 (2 Watt) GSM 1900: PCL = 0 (1 Watt)	--
Modulation	GSM: GMSK-Modulation Scheme EDGE: 8-PSK Modulation Scheme	--
DTX	off	--
Bitstream	PRBS 2E9-1 (pseudo-random-sequence) – CCITT 0.153	
Timeslot	3	
Hopping	off	
Timeslot (slot mode)	GSM-Mode: single GPRS-Mode: maximum allowed uplink slots no. according MS class	
MS slot class	Class 10	
Maximum data transmission rate, single time slot	GSM: 17,6 kBit/s Slot EDGE: 59,2 kBit/s Slot	
Speech transcoding (Traffic Mode)	Full rate Version 1	
Mode	BCCH and TCH	
BCCH – base station (CMU,CMD)	GSM 850: 182 GSM 1900: 651	
TCH – base station (CMD, CMU)	auto	
Power level TCH – base station (used timeslot level)	- 70 dBm	
Power level BCCH – base station (control channel level)	- 80 dBm	
External attenuation RF/AF-Input/Output	Accord. calibration prior to measurements	
Mobile Country Code	310	310
BS_AG_BLKES_RES	Not applicable	0
Paging reorganisation		Off (0)
Signalling channel		SDCCH
Location Update		Auto
Cell access		Disabled (barred)

#### Settings for CMU (general)

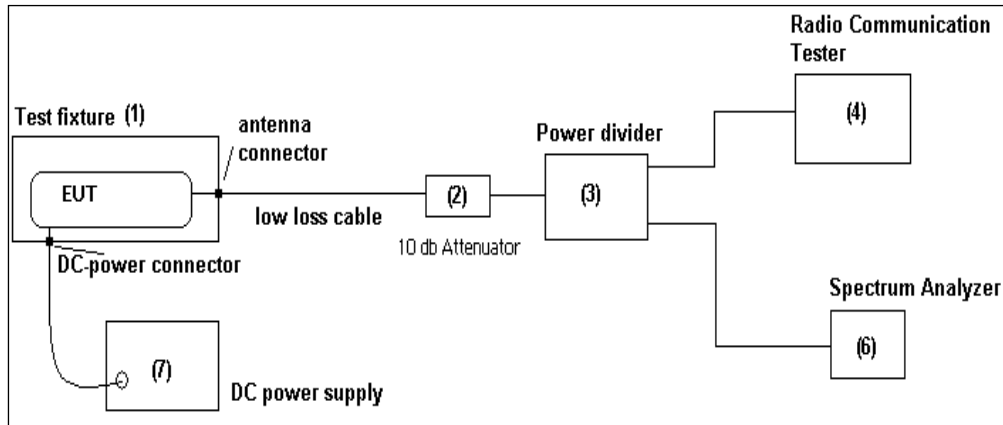

Repetition	Continuous
Stop condition	None
Display mode	Max./Min
Statistic Count	1000 Bursts
Decoder	Standard

Additional settings on the base stations CMU200 for frequency stability measurements

## 4. DESCRIPTION OF TEST SET-UP's

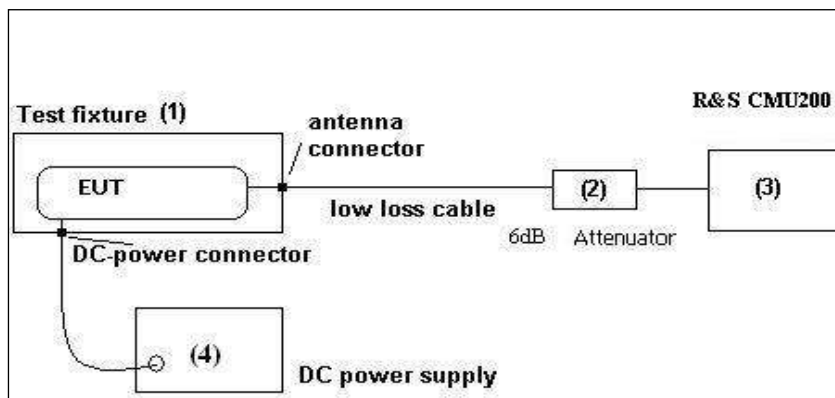

### 4.1. Test Set-up for conducted measurements

The EUT's RF-signal is coupled out by a suitable antenna coupling connector (1). The signal is first 10 dB attenuated (2) before it is 0° divided by a power divider (3). One of the signal path is connected to the communication base station (4), other branch is connected to the spectrum – analyzer (6). The specific attenuation losses for both signal paths/branches are determined prior to the measurement within a set-up calibration. These are then taken into account by correcting the measurement readings on the spectrum-analyzer.

Schematic 1: Test set-up conducted in the Radio Laboratory for occupied bandwidth, frequency stability and spurious emissions measurements.

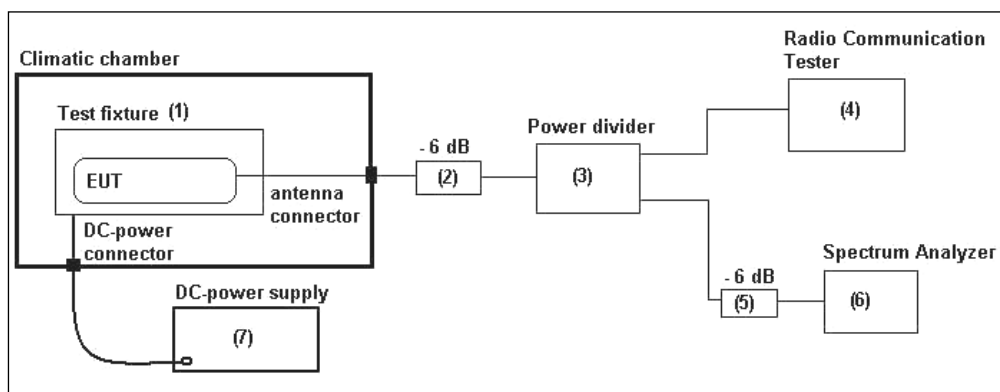

The EUT's RF-signal is coupled out by a suitable antenna coupling connector (1). The signal is first 6 dB attenuated (2) before it is connected to the co communication base station CMU200 (3). The specific attenuation losses for signal path is determined prior to the measurement within a set-up calibration. These are then taken into account by correcting the measurement readings on the communication base station (3).

Schematic 2: Test set-up conducted for maximum output power measurements.

Following modified test set-up schematic apply for tests performed inside the climatic chamber:  
Frequency stability

In case an external connector is available (test fixture), following set-up is used for measurements.

Schematic 3: Test set-up conducted within climatic chamber

## 4.2. Test set-up for radiated measurements

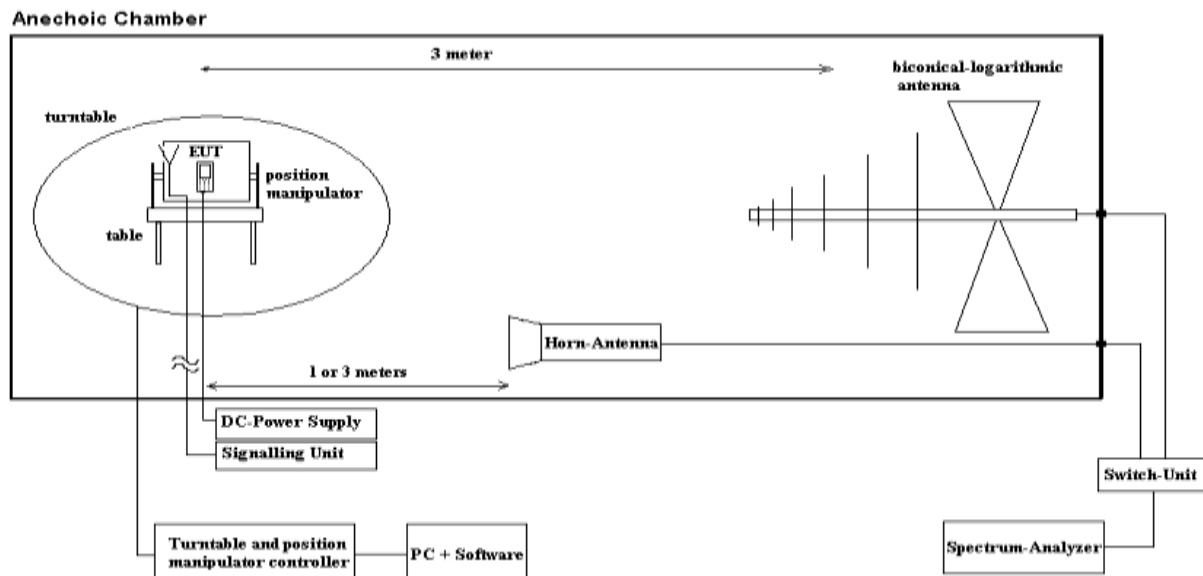

The radiated emissions from the test device are measured first as exploratory measurement in a FCC recognized semi anechoic chamber (registration no. 99538) or fully anechoic chamber with the dimensions of 8.05m x 6.85m x 5.48m. Very critical frequencies within a defined range, can be re-checked on CETECOM's Open Area Test side, recognized by the FCC to be compliant with ANSI 63.4: 2003 according registration no. 99538

The EUT and accessories are placed on a non-conducting tipping table of 0.8 meter height (semi-anechoic chamber) or 1.55m height (fully-anechoic chamber) which is situated in the middle of the turntable. The turntable can rotate the device under test 360 degree, the tipping table can rotate the device from laid to standing position. This way the device under test can be rotated in all three orthogonal planes in order to maximize the detected emissions. The turn- and tipping table are controlled by a controller unit. All positions manipulations are software controlled from a operator PC.

The measurements are performed for both receiving antenna polarisations: vertical and horizontal.

Up to 18GHz a measurement distance of 3 meters is used, above 18GHz the distance is 1meter. A biconical-logarithmic antenna up to 1 GHz and a horn antenna for frequencies above 1 GHz used. (see equipment list)

The EUT is powered either by a external DC-supply with nominal voltage or a AC/DC power supply as accessory. The communication signalling is performed from outside the chamber with a communication test simulator (CMU200 from Rohde&Schwarz) by airlink.

Schematic: radiated measurements test set-up

## 5. Measurements

### 5.1. RF power output (Conducted and Radiated)

#### REFERENCES

FCC: §2.1046 (conducted), §22.913(a)(2), § 24.232(c)

IC: RSS-132:4.4 + SRSP 503:5.1.3 for GSM 850; RSS-133:6.4 + SRSP-510:5.1.2 for GSM 1900

- Maximum Power Output of the mobile phone should be determined while measured conducted and radiated way.

#### TEST SET-UP (CONDUCTED)

- see conducted measurement set-up, description in chapter 4.1, schematic 2
- a suitable artificial antenna or RF-connector is provided by the applicant in order to perform the conducted measurements. Any data provided with the artificial antenna or connector, have been taken in account in order to correct the measurement data.

#### MOBILE PHONE SETTINGS

- according 3.7

#### BASE STATION SETTING

- according 3.7

#### TEST METHOD

- The measurements were made at the upper, middle and lower carrier traffic frequencies of the operating band. Choosing three TX-carrier frequencies of the mobile phone within each operable GSM band, should be sufficient to demonstrate compliance.
- The measurements were performed with the integrated power measurement function of the „radio communication tester *CMU* from *Rohde&Schwarz* company. In this way spectrum-analyzers instrument limitations can be avoided or minimized. Instead, *CMU* manufacturers declared measurement error can be considered for this measurement.
- The attenuation (insertion loss) at the RF Inputs/Outputs of *CMU* were set according the path loss of the test set-up, determined in a step before starting the measurements.
- PK and Average values have been recorded for each channel and band.

## RESULTS (CONDUCTED)

### Op. Mode 1, Set-up 3

Channel/ Frequency (MHz)		Peak Output Power (dBm)	Average Output Power (dBm)
GSM 850	Channel 128/ 824.2 MHz	32.1	32.0
	Channel 190/ 836.6 MHz <sup>*)</sup>	32.3	32.1
	Channel 192/ 837.0 MHz	32.3	32.2
	Channel 251/ 848.8 MHz	32.4	32.3

Remark: -

<sup>\*)</sup> Channel 190 was tested for customers information too

### Op. Mode 2, Set-up 3

Channel/ Frequency (MHz)		Peak Output Power (dBm)	Average Output Power (dBm)
GSM 1900	Channel 512/ 1850.2 MHz	29.2	29.0
	Channel 661/ 1880.0 MHz	29.6	29.4
	Channel 810/ 1909.8 MHz	29.9	29.7

Remark: -

PAR factor for GSM Modulation is approx 0.1 to max. 0.2 far away from the limit of 13dB as stated in the rules.

## VERDICT: Passed

## AMBIENT ENVIRONMENTAL CONDITIONS

Temperature	21.5 °C
Relative Humidity	40.5 %
Air pressure	1008 hPa

## TEST EQUIPMENT

Used equipment (see reference in the annex)
R&S CMU200 Ref. No. 436, Cable OTA20, attenuator 6dB, Ref. No. 248

### 5.1.1. Radiated RF-Power

#### TEST METHOD

The measurements were made at the upper, center, and lower carrier traffic frequencies of each of the supported operating band. Choosing three TX-carrier frequencies of the mobile phone, should be sufficient to demonstrate compliance.

The measurements were performed by using the **substitution method** (ANSI/TIA/EIA 603) with a spectrum-analyzer. This method can be described like follows:

- 1.) choosing of suitable spectrum-analyzer settings for performing the measurements. This settings of the spectrum analyzer must be maintained for both stages of the measurements: EUT emission measurements and also for measurements of the substituted level.

Parameter	Setting for GSM measurements	Settings for UTRA/FDD measurements
RBW	1 MHz	10 MHz
VBW	10 MHz	10 MHz
Span	8 MHz	8 MHz
Detector Mode	Positive max-hold	Positive max-hold
Average	off	off
Sweep Time	coupled	coupled

- 2.) The maximum level of the peak power was recorded, while the emissions were maximized by rotating the EUT in three orthogonal axes, which was situated on a non-conductive turntable of 1.55 m height ( $P_{MEAS,1}$ ). This was performed for both measuring antenna polarisations (vertical/horizontal), the maximum of both values is used for further measurements and final substitution ( $P_{MEAS,1,MAX}$ ).
- 3.) As the maximum emission is recorded, the EUT is replaced by a frequency dependant suitable antenna, which is connected to a RF-signal generator, which is transmitting on the determined worst-case frequency as determined in step 2.
- 4.) The RF-signal level of the signal generator is adjusted as long the same worst-case level determined first step is measured at the spectrum analyzer ( $P_{SMHU}=P_{MEAS,1,MAX}$ )
- 5.) Than the RF-signal cable is disconnected from the antenna and connected to a power-level meter. The level is determined ( $P_{MEAS,2}$ ).
- 6.) The final result is calculated by adding the ERP/EIRP gain of the antenna which substitutes the EUT.  

$$P_{EUT,SUBST} = P_{MEAS,2} + G_{Antenna}$$

#### GSM RESULTS (RADIATED):

##### OP. MODE 1, SET-UP 1

Channel/ Frequency (MHz)		Peak Output Power (dBm)			Antenna Polarisation for maximum Power	Verdict
		PK	AV			
GSM 850	Channel 128/ 824.2 MHz	25.06	1.)	ERP-Value	V/H	Passed
	Channel 192/ 837.0 MHz	29.01				
	Channel 251/ 848.8 MHz	23.81				
E-GPRS 850	Channel 128/ 824.2 MHz	Not supported mode		ERP-Value	V/H	--
	Channel 192/ 837.0 MHz					
	Channel 251/ 848.8 MHz					

Remark: -

- 1.) PAR factor can be used from conducted measurement and subtracted from radiated ERP PK-value.

**Op. Mode 2, Set-up 1**

Channel/ Frequency (MHz)		Peak Output Power (dBm)			Antenna Polarisation for maximum Power	Verdict
		PK	AV			
GSM 1900	Channel 512/ 1850.2 MHz	27.25	1.)	EIRP-Value	V/H	Passed
	Channel 661/ 1880.0 MHz	27.59				
	Channel 810/ 1909.8 MHz	27.42				
E-GPRS 1900	Channel 512/ 1850.2 MHz	Not supported mode		EIRP-Value	V/H	--
	Channel 661/ 1880.0 MHz					
	Channel 810/ 1909.8 MHz					

Remark: -

1.) PAR factor can be used from conducted measurement and subtracted from radiated EIRP PK-value.

**AMBIENT ENVIRONMENTAL CONDITIONS**

Temperature	20.2 °C
Relative Humidity	46 %
Air pressure	1011 hPa

**TEST EQUIPMENT**

Used equipment at FAR system[Ref. No.443] (see reference in the annex)
549, 443, 439, 264, 460

## 5.2. Occupied bandwidth

### REFERENCES

FCC: §2.1049; §22.917(a), §24.238(a)

IC:RSS-Gen:4.6.1

„the **occupied bandwidth** is the frequency bandwidth, such that, below it lower and above it upper frequency limits, the mean powers radiated are each equal to 0.5 percent of the total mean power radiated.

### TEST SET-UP

- see conducted measurement set-up described in 4.1, schematic 1

### MOBILE PHONE SETTINGS

- Provisions with the requirements is based on the fact, that GSM modulation scheme is GMSK Modulation for GSM equipment with a maximum data transmission rate of 17,6 kBit/s per Slot.
- Provisions with the requirements is based on the fact, that EDGE modulation scheme is 8-PSK Modulation for EDGE equipment with a maximum data transmission rate of 69,2 kBit/s per Slot.
- according settings described in chapter 3.7 a call was established

### SETTINGS OF THE SPECTRUM-ANALYSER

Frequency range	RBW (resolution bandwidth)	VBW (video bandwidth)
<i>1 MHz around carrier frequency</i>	<i>1% from applicants stated/measured emission bandwidth</i>	<i>3..10 times the RBW</i>

### TEST METHOD

The measurements were made at the upper, middle and lower carrier traffic frequencies of the operating band. Choosing three TX-carrier frequencies of the mobile phone within each operable GSM band, should be sufficient to demonstrate compliance

Additionally the emission bandwidth (-26 dBc bandwidth) was recorded for all three channels. The results were taken in order to determine according the §24.238 the measurement resolution bandwidth, which should be approximately 1% of the emission bandwidth.

## RESULTS

### Set-up 3, Op-Mode 1

Channel/ Frequency (MHz)		Occupied 99% bandwidth [kHz]	Emission bandwidth [kHz]
GSM 850	Channel 128/ 824.2 MHz	245.192	315.705
	Channel 192/ 837.0 MHz	245.192	317.307
	Channel 251/ 848.8 MHz	245.192	314.102

Remarks: See separate document A1 for more details

**Set-up 3, Op-Mode 2**

Channel/ Frequency (MHz)		Occupied 99% bandwidth [kHz]	Emission bandwidth [kHz]
GSM 1900	Channel 512/ 1850.2 MHz	245.192	314.102
	Channel 661/ 1880.0 MHz	245.192	315.705
	Channel 810/ 1909.8 MHz	245.192	312.500

Remarks: See separate document A1 for more details

**AMBIENT ENVIRONMENTAL CONDITIONS**

Temperature	19.8 °C
Relative Humidity	39 %
Air pressure	1007 hPa

**TEST EQUIPMENT**

Used equipment at the Radio Laboratory [ref.no. 347] (see reference in the annex)
298, 354, 468, 489, 529, 530, 517 (RF-Relay Unit Keithley)

Equipment set up	<input checked="" type="checkbox"/> table top	<input type="checkbox"/> floor standing	
Climatic conditions	Temperature: (24°C)		Rel. humidity: (30)%
EMI-Receiver (Analyzer) Settings	Span/Range: 9kHz to 150kHz; 150 kHz to 30 MHz RBW/VBW: 200Hz/auto; 10 kHz/ auto (CISPR#16) Detector/ Mode: PEAK, TRACE max-hold mode, repetitive scan for exploratory measurements Quasi-Peak, for final measurement on critical frequencies (fy<1GHz)		

### GENERAL MEASUREMENT PROCEDURES:

The measurement test set-up and test procedure are in accordance with the provisions described in ANSI 63.4: 2009

The **Equipment under Test** (EUT) was set-up to defined operating mode and installed (connected) to accessory equipment according the general description of use given by the applicant.

The measurement loop antenna was situated in 3m distance to the EUT. Radiated magnetic emission measurements were made with the antenna situated in 1 meter height. The loop antenna was moved at least to 2-perpendicular axes (antenna vector in direction of EUT and parallel to EUT) in order to maximize the emissions, the EUT itself either over 3-orthogonal axes (no defined usage position) or 2-orthogonal axis (defined usage position) by the position manipulator.

According the standard the compliance should be checked in 30m and 300m measurement distance. Therefore a additional extrapolation factor was used in order to normalize the measurement data. The frequency dependent extrapolation factor used for this reduced measurement distance, can be found in the chapter 9.

## MEASUREMENT RESULTS

### Channel 512

Set-up No.		2								
Operating Mode		2								
Diagram no.	Frequency (MHz)	MaxPeak (dBμV/m)	Meas. Time (ms)	Bandwidth (kHz)	Antenna height (cm)	Polarity	Turntable position (deg)	Corr. (dB) (C <sub>F</sub> )	Margin (dB) (M)	Limit (dBμV/m) (L <sub>T</sub> )
3.01	--	<15.48	1000	0.2/10.00	100.00	Parallel and 90° to the EUT	0..360°	See below Abbreviation	>14 dB	below Limit

Remark: External Interferer between 17,2 kHz – 100 kHz, see also plots enclosed in annex 1

### Channel 661

Set-up No.		2								
Operating Mode		2								
Diagram no.	Frequency (MHz)	MaxPeak (dBμV/m)	Meas. Time (ms)	Bandwidth (kHz)	Antenna height (cm)	Polarity	Turntable position (deg)	Corr. (dB) (C <sub>F</sub> )	Margin (dB) (M)	Limit (dBμV/m) (L <sub>T</sub> )
3.02	--	<14.54	1000	0.2/10.00	100.00	Parallel and 90° to the EUT	0..360°	See below Abbreviation	>15 dB	below Limit

Remark: External Interferer between 17,2 kHz – 100 kHz, see also plots enclosed in annex 1

### Channel 810

Set-up No.		2								
Operating Mode		2								
Diagram no.	Frequency (MHz)	MaxPeak (dBμV/m)	Meas. Time (ms)	Bandwidth (kHz)	Antenna height (cm)	Polarity	Turntable position (deg)	Corr. (dB) (C <sub>F</sub> )	Margin (dB) (M)	Level (dBμV/m) (L <sub>T</sub> )
3.03	--	< 15	1000	0.2/10.00	100.00	Parallel and 90° to the EUT	0..360°	See below Abbreviation	>18 dB	Below Limit

Remark: External Interferer between 17,2 kHz – 100 kHz, see also plots enclosed in annex 1

#### Margin to Limit:

$$M = L_T - R_R + C_F + D_F$$

$$= L_T - R_R + (AF_{ANTENNA} + Cable_{LOSS}) + D_F$$

Remark: positive margin means passed result

#### Abbreviations used:

- R<sub>R</sub> : Receiver readings in dBμV/m
- C<sub>F</sub>: Transducer in dB = AF (antenna factor) + CL (cable loss)
- D<sub>F</sub>: distance correction factor (if different measurement distance used than specified in the standard)
- L<sub>T</sub> : Limit in dBμV/m

## VERDICT

Radiated frequencies below 30 MHz: Passed

## 5.4. Emission limits (Spurious emission conducted/radiated)

### REFERENCES

FCC: §2.1051-conducted, §15.111-conducted antenna terminal, §2.1053(a)-radiated, §22.917(a)(b); §24.238(a)(b), §2.1057(1)

IC: RSS-132:4.5.1, RSS-133:6.5.1 - TX-mode

RSS-132:4.6, RSS-133: 6.7(b) – RX-mode

„the power of emissions shall be attenuated below the transmitter output power (p) by at least least  $43 + 10 \log(P)$  dB“

### FREQUENCY RANGE

**TX:** The spectrum was scanned from 30 MHz to the 10th harmonic of the highest frequency generated within the equipment. The detector used was Peak.

**Limit TX:** The specification that all emissions shall be attenuated below the transmitter power (P) by at least  $43 + 10 \log(P)$  dB, translates in the relevant power range of the mobile phone (1 to 0.001 W) to a constant limit of -13 dBm.

### DESCRIPTION OF SET-UP

- see conducted set-up in chapter 4.1
- see radiated set-up in chapter 4.2

### SETTINGS ON MOBILE PHONE

- The measurements in TX-mode were made at the upper, middle, and lower carrier frequencies of the operating band. Choosing three representative TX-carrier frequencies of the mobile phone within each operable GSM band, should be sufficient to demonstrate compliance with the emissions limits outside and adjacent to the frequency blocks.
- The measurements in RX-Mode were made at the middle tuning range of the receiver.
- The individual settings on base station and mobile phone were made according chapter 3.7

### TEST METHOD RADIATED:

By rotating the EUT in three orthogonal planes, the emissions were recorded with Peak-Detector and Hold-Max function of the spectrum-analyzer. If the harmonic could not be detected above the noise floor, the ambient level was recorded. Measurement distance is 3m for frequencies up to 18GHz and 1m for frequencies greater than 18GHz. The readings on the spectrum analyzer are corrected with annually performed chamber path calibration values (see chapter 7), so the readings shown are equivalent to ERP/EIRP values. Critical measurements near the limit, are re-measured with a substitution method accord. ANSI/TIA/EIA 603.

### SETTINGS OF SPECTRUM-ANALYSER

Frequency range	RBW (resolution bandwidth)	VBW (video bandwidth)
<b>BAND-EDGE compliance:</b> 1MHz immediately adjacent to the frequency blocks	1% from applicants stated/measured emission bandwidth	3..10 times the RBW
More than 1 MHz outside and adjacent the frequency blocks	1 MHz	3..10 MHz

## RESULTS (CONDUCTED)

### 5.4.0.1. GSM TCH 850: Op. Mode 1, Set-up 3

#### Lowest channel: 128

Transmitting channel/ frequency: TX = 824.2 MHz							
Sweep frequency range: [MHz]	Diagram numbers	Remarkable highest peak found at [MHz]	Transducer	Margin to limit [dB]	Result [dBm]	Limit [dBm]	Verdict
Sweep 1	14.01	0.0343	--	--	-53.04	-13	Passed
Sweep 2	14.04	1648.0	--	--	-36.30		Passed <sup>1.)</sup>

## 5.5. Frequency stability on temperature and voltage variations

### REFERENCES

FCC: §2.1055, §22.355, §24.235

IC: RSS-Gen:4.7, RSS-132:4.3, RSS-133:4.2+6.3

#### §22.355 Table C-1; § 24.235

*“The frequency stability shall be sufficient to ensure that the fundamental emission stays within the authorized frequency block”*

#### § 2.1055

*(d) The frequency stability shall be measured with variation of primary supply voltage as follows:*

- (1) Vary primary supply voltage from 85 to 115 percent of the nominal value for other than hand carried battery equipment.*
- (2) For hand carried, battery powered equipment, reduce primary supply voltage to the battery operating end point which shall be specified by the manufacturer.*

### TEST SET-UP

In order to maintain the voltage constant over the time period of the tests, a dummy battery was connected to a laboratory power supply. The power supply voltage was controlled on the input of the power supply terminals of the EUT.

Compare with the conducted measurement test set-up described in chapter 4.1

### MOBILE PHONE SETTINGS

- The measurements were made at the upper, middle, and lower carrier frequencies of the operating band. Choosing three representative TX-carrier frequencies of the mobile phone within each operable GSM band, should be sufficient to demonstrate compliance.
- Settings on base station and mobile phone were made according chapter 3.7

### TEST METHOD

The RF Channel spacing is 200kHz, with a guard band of 200kHz of each band of the sub-bands. The aim of the EUT is to function under all extreme conditions within authorized sub-bands in regard to temperature and voltage variations. The frequency deviation was recorded with base station's built in capability. (CMU) As the standard requires that the fundamental emissions stays within the authorized band, a limit of 0.1ppm is considered low enough to ensure this.

### Frequency shift of carrier against a voltage range at constant nominal temperature of 20° Celsius

- 1.) determine the carrier frequency for the lowest and highest channel at room temperature and nominal voltage [20°C]
- 2.) The voltage was reduced in 0.1V steps to the lower end point, where the mobile phone stops working. (this shall be specified by the manufacturer) Record the carrier frequency shift within 2 minutes after powering on the mobile phone, to prevent for self heating effects.
- 3.) The voltage was increased in 0.1V steps to the upper declared voltage of the battery. Record the carrier frequency shift within 2 minutes after powering on the mobile phone, to prevent for self heating effects.

## RESULTS

### 5.5.0.1. GSM 850 Mode: Op. Mode 1, set-up 3

4,5=Maximum	45	49	40	0,024	0,026	0,021

Remark: --

### Frequency shift of carrier against temperature at constant power supply voltage

- 1.) determine the carrier frequency for the lowest, middle and highest channel at room temperature and nominal voltage [20°C]
- 2.) expose the mobile station to -30°C, wait sufficient time to have constant temperature.
- 3.) Perform the carrier frequencies measurements in 10°C increments from -30°C to +50°C. For about half hour at the specified temperature the mobile was powered-off. After powering-on, the measurements were made within 2 minute for the channel lower channel, in order to prevent self-warming of the mobile.

## RESULTS

### 5.5.0.3. GSM850 Mode: Op. Mode 1, set-up 3

**Standards and Limits: Part 15, Subpart C, §15.207, CANADA: RSS-Gen:7.2.2, ANSI C63.4:2009**

Frequency [MHz]	Conducted limit [dBμV] §15.107 Class B, §15.207 QUASI-Peak	AVERAGE
0.15 – 0.5	66 to 56*	56 to 46*
0.5 – 5	56	46
5 – 30	60	50

Remark: \* decreases with the logarithm of the frequency

### Test condition and measurement procedures test set-up

link to test system (if used):	<input checked="" type="checkbox"/> air link	<input type="checkbox"/> cable connection	<input type="checkbox"/>
EUT-grounding	<input checked="" type="checkbox"/> none	<input type="checkbox"/> with power supply	<input type="checkbox"/> additional connection
Equipment set up	<input checked="" type="checkbox"/> table-top (40 cm distance to reference ground plane (wall))	<input type="checkbox"/> floor-standing EUT stands isolated on reference ground plane (floor)	
Climatic conditions	Temperature: (23°C)	Rel. humidity: (77)%	
EMI-Receiver (Analyzer) Settings	Span/Range: 150 kHz to 30 MHz RBW: 9 kHz Detector/Mode: Max PEAK-hold, repetitive scan for preliminary testing Quasi-Peak Detector and Average-Detector for final measurement according ANSI 63.4, CISPR 16		

Devices which can be connected to the public AC-power network, should be tested against the radio frequency voltage conducted back into the AC-power line in the frequency range 150kHz to 30 MHz. Compliance should be tested by measuring the radio frequency voltage between each power line and ground at the power terminals in the stated frequency range.

A 500Ω/50μH line impedance stabilization network (LISN) is used therefore. The EUT power input leads are connected through the LISN to the AC-power source. The LISN enclosure is electrically connected to the GND-plane. The measuring instrument is connected to the coaxial output of the LISN.

Tabletop devices were set-up on a 80 cm height over reference ground plane, floor standing equipment 10 cm raised above ground plane.

Measurements have been performed on each phase line and neutral line of the devices AC-power lines. The EUT was power supplied with 110 V/60Hz.

The EUT was tested in the defined operating mode and installed (connected) to accessory equipment according the general description of use given by the applicant.

**Preliminary testing** as a first step, determines the worst-case phase line (neutral or phase) as well as the most critical amplitude by changing the operating mode. A complete frequency-sweep is performed with PK-Detector.

**Final testing** for power phases and critical frequencies (Margin to AV- or QP limit lower than 3dB) as a second step includes measurements either on discrete frequency components with receivers detector set to Quasi-Peak and Average per frequency component or a complete sweep with corresponding detector.

### Measurement results

For showing compliance with conducted limits a commercial available AC/DC adapter (AE2) was chosen for delivering the required 9 V DC to the DSB75 board (EUT E).

EUT Type and S/N or EUT set-up no.		4			
Diagram No.	Command or EUT operating mode or operating mode no.	Detector (Peak, CISPR AV, CISPR QP)	Power line (L1, L2, L3, N)	Additional (scan-) information (e.g. Pre-test Fast scan, Maxhold, Final measurement)	Result (passed / failed /final measurement . necessary)
1.4	EUT operating mode 1	Peak, AV,QP	L1, N	The Diagram shows PK/AV detector measurements on L1 and N with max-hold mode. Final measurement QP and AV was carried out on at least one frequency	passed
1.2	EUT operating mode 2	Peak, AV,QP	L1, N	The Diagram shows PK/AV detector measurements on L1 and N with max-hold mode. Final measurement QP and AV was carried out on at least one frequency	passed

Remarks: pls. see annex 1 for detailed diagrams

Margin to Limit for verdict:  $M = L_T - R_R + C_{Loss}$

Abbreviations used:

- $R_R$  : Receiver readings in dB $\mu$ V
- $C_{Loss}$  : cable loss
- $L_T$  : Limit in dB $\mu$ V

### Verdict

Summary of measurement results for conducted emissions on AC-Power lines: Passed

### Additionally test equipment

Used equipment (see reference in the annex)
016 (Spitzenberger Spies 110V&60Hz)
468 (FLUKE 112 MM)

## 6. Calibration method of anechoic chamber

For non-critical frequencies a pre-calibration method was used for determining the relevant radiated field-strength of radiated spurious in the anechoic chamber.

Generally the measured value is influenced by the characteristics of the used cables, filters, antenna, but also by the characteristic of the anechoic chamber.

By defining a **transducer** value, which include all characteristics of the signal propagation path (used equipment, cables, properties of anechoic chamber, etc..) from the source of radiation to the final reading equipment (spectrum-analyzer), the measured value can be corrected in order to get the real value of the device under test.

The method resumes as follows:

- 1.) determination of the path-loss of all cables used on the TX- and RX-side, which are used for the radiated measurement in the specific set-up for 1 meter and 3 meter distance.
- 2.) connection of the cables to the relevant antennas used for calibration.
- 3.) determination of the **space attenuation loss** ( $G$ ) in the anechoic-chamber for both horizontal and vertical antenna polarisations:

A signal generator connected to the TX-antenna sweeps the frequency range of interest (30 MHz to 19.5 GHz) with a level of -30dBm - the readings on the RX-side on the spectrum analyzer gives the **space attenuation loss**. The distance between RX- and TX-antenna is 3 meter for frequencies below 18 GHz, and 1 meter for frequencies above 18 GHz.

- 4.) Mathematical determination of the frequency dependant transducer values ( $TD_{H/V}$ ):

$$TD_{H/V} = G_{H/V} + B_{H/V} - 10 \cdot \log_{10}(1,64) + D + E - F$$

### Abbreviations:

$TD_{H/V} = \lambda/2$  transducer values for horizontal /vertical antenna polarisations

$G_{H/V}$  = space attenuation loss horizontal/ vertical

$B_{H/V}$  = Gain of TX-antenna

$10 \cdot \log_{10}(1,64)$  = Gain in dB of  $\lambda/2$  Dipole relative to isotropic radiator

D = insertion losses of RX cable

E = Loss of filters in signal path (not used for FCC measurements)

F = Gain of pre-amplifiers in signal path

- 5.) The transducer values are recorded for horizontal and vertical polarisations in two reference distances to the measurement antenna (1 meter and 3 meter). EIRP can be calculated from ERP by adding the gain of the lambda/2 dipole  $EIRP = ERP + 2,14 \text{ dBi}$
- 6.) The specific transducer tables are loaded in the spectrum analyzer after each measurement. The readings on the spectrum-analyzer are automatically corrected by this values and can directly be compared with the limits as given in the relevant standards. The loaded values are displayed in each diagram and can be compared to internal calibration documents annually performed.

Used equipment for calibration (3 meter distance)

Used equipment (see reference)
264, 549, 020, 140, 484, 439,

Used equipment for calibration (1 meter distance)

Used equipment (see reference)
302, 303, 140, 264

## 7. Measurement uncertainties

The reported uncertainties are calculated based on the standard uncertainty multiplied with the appropriate coverage factor **k**, such that a confidence level of approximately 95% is achieved.

For uncertainty determination, each component used in the concrete measurement set-up was taken in account and it's contribution to the overall uncertainty according it's statistical distribution calculated.

Following table shows expectable uncertainties for each measurement type performed.

Measurement	Frequency range	Calculated uncertainty based on a confidence level of 95%	Remarks:
RF-Power Output conducted	9 kHz .. 20 GHz	1.0 dB	--
RF-Power Output radiated	30 MHz .. 4 GHz	3.17 dB	Substitution method
Conducted RF-emissions on antenna ports	9 kHz .. 20 GHz	1.0 dB	--
Radiated RF-emissions enclosure	150 kHz .. 30 MHz	5.0 dB	Magnetic field
	30 MHz .. 1 GHz	4.2 dB	E-Field
	1 GHz .. 18GHz	4.8 dB	E-Field
	1 GHz .. 20 GHz	3.17 dB	Substitution method
Occupied bandwidth	9 kHz .. 4 GHz	0.1272 ppm (Delta Marker method)	Frequency error
		1 dB	Power
Emission bandwidth	9 kHz .. 4 GHz	0.1272 ppm (Delta Marker method)	Frequency error
		1 dB	Power
Frequency stability	9 kHz .. 20 GHz	0.0636 ppm	--
Conducted emissions on AC-mains port (U <sub>CISPR</sub> )	9 kHz .. 150 kHz	4.0 dB	--
	150 kHz .. 30 MHz	3.6 dB	

**Table : measurement uncertainties, valid for conducted/radiated measurements**

## 8. Instruments and Ancillary

### 8.1. Used equipment “CTC”

The “Ref.-No” in the left column of the following tables allows the clear identification of the laboratory equipment.

#### 8.1.1. Test software and firmware of equipment

### 8.1.3. Legend

Note / remarks		Calibrated during system calibration:
	1a	System CTC-SAR-EMS (Ref.-No. 442)
	1b	System-CTC-EMS-Conducted (Ref.-No. 335)
	1c	System CTC-FAR-EMI-spurious emission (Ref.-No. 443)
	1d	System CTC-SAR-EMI (Ref.-No. 441)
	1e	System CTC-OATS (EMI radiated) (Ref.-No. 337)
	1 f	System CTC-CTIA-OTA (Ref.-No. 420)
	1 g	System CTC-FAR-EMS (Ref.-No. 444)
	2	Calibration or equipment check immediately before measurement
	3	Regulatory maintained equipment for functional check or support purpose,
	4	Ancillary equipment without calibration e.g. mechanical equipment or monitoring equipment
	5	Test System

Interval of calibration	12 M	12 month
	24 M	24 month
	36 M	36 month
	24/12 M	Calibration every 24 months, between this every 12 months internal validation
	36/12 M	Calibration every 36 months, between this every 12 months internal validation
	Pre-m	Check before starting the measurement
	-	Without calibration

The used correction factors when the measurement distance is reduced, are taken from IEEC Transaction EMC, Vol 47, No.3, Aug. 2005, Journal Paper “*EXTRAPOLATING NEAR-FIELD EMISSIONS OF LOW-FREQUENCY LOOP TRANSMITTERS*”.
